Environmental Management Certification (ISO 14001): Effects on Hotel Guest Reviews

Abstract
A survey of guests at 6,850 hotels in Spain found that the guests gave higher satisfaction ratings to hotels that held the ISO 14001 certification than to hotels without the certification. As an international standard aiming at development of effective environmental management systems, the ISO 14001 standard specifies a path for the continuous improvement and the control of a firm's environmental performance. The study explored the differences in the overall customer ratings for the certified hotels overall and for several individual services and attributes, including housekeeping and overall comfort. Interestingly, the most significant differences were found between upscale 4-star hotels with and those without certification, while differences relating to certification in 5- and 3-star hotels were muted. While the study does not reveal causes for these findings, the implication is that the highest-end luxury hotels do not gain distinctive differentiation by having the ISO 14001 certification, while for 3-star hotels, guests’ price sensitivity apparently overrides environmental concerns. That said, the results imply that acquiring ISO 14001 certification may give upscale hotels a distinctive asset that leads them to a competitive advantage over similar non-certified properties. Moreover, ISO 14001 seems to contribute to the value creation by the hotels, based on their higher guest ratings.

ABOUT THE AUTHORS

Marival Segarra-Oña, PhD, is an associate professor of Innovation and Competitiveness at the Business School at the Politechnic University of Valencia (Spain). She holds a PhD in management and BS degrees in industrial engineering and mechanical engineering. Prof. Segarra is also a Research Associate of the Center for Hospitality Research, CHR, Cornell University, and member of the Jury of the 40th Anniversary contest of Sustainable Innovations of the European Patent Office. Dr. Segarra teaches MBA classes at the Spanish Deloitte executive master since 2008 and has published several articles in prestigious journals as Cornell Hospitality Quarterly, Innovation: The European Journal of Social Science Research or Engineering Management Journal, among others.

Angel Peiró-Signes, PhD, holds his doctorate in business and BS degrees in industrial engineering and mechanical engineering. Prof. Peiró is an assistant professor in Analytical Accounting and Strategic Management at the Business School at the Politechnic University of Valencia (Spain) and Research Associate of the Center for Hospitality Research at the Cornell University School of Hotel Administration. Before this, he worked at the Operations Management Area at companies such Bonduelle or Unilever. His research interests are eco-innovation and economic performance applied to industrial and service sectors. Dr. Peiró has published several research papers in Cornell Hospitality Quarterly, Marine Policy, and European Planning Studies, among others.

Rohit Verma, Ph.D., is a professor of service operations management at the Cornell School of Hotel Administration. He served as the executive director of the Cornell Center for Hospitality Research during 2009–2012 and is currently the director of the school's Executive Master Program Development Project. Prior to joining the Cornell faculty, he was the George Eccles Professor of Management, David Eccles School of Business (DESB) at the University of Utah. He has also taught MBA and executive development classes at several universities around the world, including DePaul University, German Graduate School of Business and Law, Helsinki School of Economics, Indian School of Business, Norwegian School of Logistics, Nyenrode University, and University of Sydney. Verma has published over 50 articles in prestigious journals and serves on the editorial review boards of Production and Operations Management, Cornell Hospitality Quarterly, and Journal of Service Research. He has co-edited special issues of Cornell Hospitality Quarterly, Decision Sciences, Journal of Operations Management, and Journal of Service Management. His is the co-author of Operations and Supply Chain Management for the 21st Century, and co-editor of Cornell School of Hotel Administration on Hospitality: Cutting Edge Thinking and Practice, a professional reference book that includes works of several of his colleagues at Cornell.

José Mondéjar-Jiménez holds a European PhD in Economics and a Degree in Business Administration by the University of Castilla-La Mancha (Spain). He is an Associate Professor in Statistics and Dean of the Social Sciences School of Cuenca (University of Castilla-La Mancha). His research interest are regional analysis and tourism and environment. Dr. Mondéjar has published more than 30 impact articles in prestigious journals as Environmental Engineering Management journal or The Service Industries Journal.

Manuel Vargas-Vargas holds a PhD in Economics by University of Castilla-La Mancha and a Degree in Math and Science by the University of Granada. He is an Associate Professor of Statistics at the University of Castilla-La Mancha (Spain) and he is actually the coordinator of the Menéndez Pelayo International University (UIMP) in Cuenca. Dr. Vargas main areas of interests are applied economics, quantitative environmental methods, statistical analysis and tourism. Dr. Vargas has published several papers at journals as the International Journal of Environmental Research and The Service Industries Journal.

Acknowledgments. The authors would like to thank the Center for Hospitality Research at Cornell University which hosted A. Peiró and M. Segarra as Visiting Scholars, and the Spanish Economy and Competitiveness Ministry for its support through the research project (EC02011-27369).
The hotel industry’s practices regarding environmental sustainability have been widely studied and a series of published studies show that commitment to environmental practices influences hotels’ economic performance. Furthermore, research shows that there is a growing consensus on the practices that allow hotels to become more environmentally sustainable. Despite the industry’s progress in becoming sustainable, hotels still have yet to determine the most effective way to promote their green status. Formal certification is gradually becoming a common approach for hotels to demonstrate their commitment and focus to sustainability. Among the third parties offering certification are online travel agencies such as Travelocity.com, which has started “green-flagging” hotels based on their environmental certifications, and the U.S. Green Building Council, which offers LEED certification. In Europe and especially in Spain, ISO 14001 is the leading environmental certification.

ISO 14001 is an international standard for sustainable operation. The ISO 14001 Environmental Management System was developed in 1996 by the International Standards Organization. The aim of ISO 14001 is the development of effective environmental management systems that can be applied to any type of company. According to ISO, the 14001 standard specifies a path for continuous improvement and control of a firm’s environmental performance. It enables a company to identify and control the environmental impact of its products, processes, and services and also to improve its environmental performance.

The ISO 14001 standards are consistent with the definition of a “green” hotel put forth by the American “Green” Hotel Association, as follows: “Green hotels are environmentally friendly properties whose managers are eager to institute programs that save water, save energy, and reduce solid waste—while saving money.” Because ISO 14001 provides assurance to company management and employees, as well as external stakeholders, that environmental impact is being measured and improved, the standard has been used as a proxy for environmental orientation in other studies.

ISO 14001 certification has two potential benefits. One is the improvement in operations due to following the certification’s methodical standards. These benefits extend to internal or operational improvements, marketing-related improvement, and financial performance improvement.

Previous Studies
Many authors have studied consumer perceptions towards green practices in the hospitality industry. These studies generally show that environmental practices are positively related to performance through the mediating effect of higher customer satisfaction and loyalty. They also show that eco-labels and environmental certifications lead to enhanced customer awareness of restaurants and hotels’ environmental efforts and act as differentiating assets.

D’Souza et al., for instance, examined visitors’ preferences and concluded that visitors preferred “eco-efficient” planning options to business-as-usual scenarios, although that support varied by market segment. According to Millar, green certification has become the most influential attribute when measuring preferences for green hotel attributes from the clients’ point of view.

Environmental certifications inform clients about a hotel’s status and, at the same time, can provide guests with an idea of what an environmentally conscious hotel does. In the past, consumers tended to be skeptical of eco-labels, but there is now more acceptance that a green certification label can have positive influence on a hotel’s financial performance, although some studies found that the effect was neutral.

However, we have seen little research in the hotel industry that evaluates whether the implementation of ISO 14001 (which certifies the hotel with a green or eco-label) specifically has any influence on clients’ services ratings. In that regard, post-stay guest ratings are generally considered to be a good proxy for customer satisfaction and loyalty. For example, a recent report from the Cornell Center for Hospitality Research has demonstrated that higher online guest ratings lead to higher occupancy, room rates, and market share.

To fill this conceptual gap, in this study we test whether environmental certifications such as ISO 14001 are related to guest ratings, as a proxy for satisfaction.

We believe that this study has important implications for hotel managers, in part because it provides insights about consumers’ preferences for environment commitment (demonstrated in this case by certification) that leads to higher guest ratings, and by implication higher rates and occupancy. In this study we measure consumer preferences, including the hotel’s housekeeping accuracy, comfort, services, staff, and total value of the guests’ stay.

**Objectives**

As we said, we have seen little hotel research that specifically evaluates the effects of ISO 14001 on guests’ hotel ratings. Given that research generally is supportive of positive impact of environmental management systems, we want to check whether hotels with an environmental commitment (certified with ISO14001) get higher client ratings than those which do not have this ISO certification.

To explore the linkages between the implementation of ISO 14001 and the various determinants of customer satisfaction and service quality, we tested guests’ satisfaction with specific hotel features. In addition to location, numerous features and amenities have been found to affect guest satisfaction, including employee attitude, price, brand name and reputation, physical property, value for money, guest-room design, services, housekeeping, hotel comfort, and hotel services.

The ISO 14001 standard places the responsibility for the environmental management system on the organization’s top management, and makes it easy to incorporate the required environmental standards into an existing quality management system. In that regard, ISO 14001 is mainly a measure of service quality which can be used to promote comprehensive organizational changes that lead to sustainable development and value creation.

So, considering, on one hand, that international standards (such as ISO 14000) are intended to help improve quality, enhance customer satisfaction, and increase sales, and, on the other hand, that service experience is directly related to hotel customer satisfaction, we analyzed ratings of housekeeping accuracy, hotel comfort, hotel services, hotel staff, and the hotel’s location and total value. All of those attributes may be considered as “service experience” from the consumer’s perspective. Thus, we expect that hotels with the ISO14001 environmental certification would receive higher customer ratings regarding the different attributes that measure customer satisfaction.

---

28 www.standardsinfo.net/info/benefits/benefits.html

To capture preference differences among various customer segments, we analyze the sample according to consumer characteristics (as did Bowie and Buttle, for instance\(^{30}\)), with clients classified into the following six groups: families with older children, families with young children, elderly couples, groups of friends, persons traveling by themselves, and young couples. We used this classification also following booking.com’s rating system,\(^ {31}\) and we want to check whether customer ratings of the hotels with the ISO14001 environmental certification vary according to type of customer.

The Sample

According to the World’s Top Tourism Destinations,\(^ {32}\) Spain is the second largest tourism earner worldwide and the first in Europe (US$56 billion), while ranking fourth in the world by arrivals (58 million). Spain is, therefore, an interesting country to explore our research questions. We analyzed guests’ ratings of 6,854 Spanish hotels with 5, 4, or 3 stars (corresponding to luxury, upscale, and midscale), 350 of which had ISO14001 certification. Guests’ evaluation data were retrieved from the hotels’ websites and from Booking.com during December 2011. Booking.com provides attribute evaluations for all the hotels, although the number of customers that rate each hotel is different (see Exhibit 1).

To double check whether the hotel held ISO certification, we sent e-mails to all fourteen certification companies in Spain requesting confirmation of certification. (We contacted all of them although just a handful of companies certify the majority of the hotels.) All but three of the certification companies sent us their list of certified hotels. We also made several web searches to check for possible missing certified hotels. We recorded guests’ general evaluation of each hotel and also ratings for housekeeping accuracy, and hotel comfort, location, services, staff, and value. For the booking.com ratings, location refers to convenience, service refers to facilities, staff refers to the quality of the hotel staff, and company size is measured by number of rooms. The database is segmented according to the six different customer segments that we studied, and we also classified hotels by star rating, with the results shown in Exhibit 2.

Data Analysis

We applied ANOVA to detect mean differences across business functions comparing ISO 14001–certified hotels with non-certified properties, using the specific client satisfaction indicators that we mentioned above: housekeeping accuracy, hotel comfort, and hotel services and location.

The ANOVA analysis seeks to break down the variability in a set of data into independent components that can be assigned to different causes. It is a statistical technique designed to analyze the significance of the mean differences of the different populations. As such, it is considered as an

---

31 Booking.com is the world leader in booking accommodations online.

The ANOVA analysis on hotel characteristics considers the relationship between nominal, ordinal, and interval variables. The ANOVA technique indicates whether we reject the null hypothesis that reflects the equal means value for each α level of significance. In this way, we confirm whether the mean of the variable performance is significantly different for the firms according to their ISO 14001 environmental certification. Additionally, the ANOVA analysis can be more useful than a two-sample t-test as it has a lesser chance of committing a type-I error.

For these analyses, we compared hotel ratings between the properties with ISO 14001 and those without. Then, we split the sample according to the number of stars, and we distinguished between the various client segments. Summarized ANOVA results with sample sizes, means, and F values are reported in Exhibit 3.

Results

The ANOVA analysis on hotel characteristics considering ADR and number of rooms showed that hotels with ISO 14001 are significantly (p < 0.001) more expensive and bigger than hotels without ISO. Segmented results by scale (measured by the number of stars) are consistent with overall results, although 3-star and 5-star ADR differences were not significant. Results of the whole sample comparison are represented in Exhibit 4.

Generally speaking, hotels with ISO 14001 show significantly greater overall customer ratings than those without ISO 14001 (p < 0.001). Over this period, the mean general rating for these properties was .16 higher than those properties without ISO, supporting the primary hypothesis of this paper.

After comparing the hotel ratings for properties with ISO 14001 and those without, we split the hotel sample according to the number of stars, as shown in Exhibits 5, 6, and 7 (on following pages). The segmented results by scale show significant differences in 4-star hotels in all the studied attributes (p < 0.001). While general ratings for 3- and 5-star hotels with ISO were higher than those without ISO, these differences weren’t statistically significant.

Splitting the ratings into the component attributes of housekeeping, comfort, location, services, staff, and value, we found significant differences between ISO hotels and non-certified hotels (p < 0.001) for housekeeping, comfort, location, and services. In particular, 4-star hotels with ISO 14001 had significantly higher ratings for these attributes, except for value, which didn’t show significant differences for this category.

Then, a series of one-way analyses of variances were conducted on each of the different client segments. ANOVA results for these segments are shown in Exhibits 8 through 13. The overall rating results for the various customer segments were similar to that of the total sample. That is, we found significant differences between certified and not certified 4-star hotels among the various respondent groups, but no significant differences in certified and uncertified 5-star hotels. For the 3-star hotels, we found a few significant differences in the ratings by the various segments. Looking at specific features, the segmented results based on the type of client show generally significant differences (p < 0.001) for housekeeping and hotel comfort.

Even though it can be seen from the means comparison analysis that hotels that have implemented ISO 14001 have, in general terms, better guest ratings, our data do not offer any indication of causality. We cannot say whether the better ratings result from having implemented the environmental certification system or some other cause. Overall, these results support the first hypothesis, which stated the contribution of ISO 14001 to value creation in the hotel business by enhancing clients’ ratings.

Conclusions

We found differences in ratings of Spanish hotels with the ISO 14001 label and those that are not so certified. Most interesting, we found significant differences between certified and non-certified hotels in the 4-star category, a finding that leads to an intriguing managerial implication. It appears that luxury hotels do not gain distinctive competency in their guests’ estimation when they hold the ISO 14001 certification, nor do the middle scale hotels (3 stars) receive a benefit from certification. However, our findings imply that 4-star hotels do get important benefits from the client point of view when the hotel is environmentally certified. This clearly indicates that 4-star hotels achieve a competitive advantage

in adopting ISO 14001. We can only speculate regarding the reason for this, but our earlier study of Spanish hotels has established the value of ISO 14001 as an aid to effective management.\textsuperscript{34} Most likely ISO 14001 gives these 4-star properties an opportunity to compete with the 5-star hotels, through an extra point of differentiation. At the same time, a 3-star property may not gain any competitive advantage by adopting ISO 14001 because customers that stay at 3-star hotels tend to be more value conscious and may not be willing to pay any extra for ISO 14001 certifications. For the 5-star hotels, ISO 14001 certification may be lost in a sea of luxurious amenities, and in any event the properties may have maxed out in guest satisfaction (and ADR), meaning that ISO 14001 would not grant further increases in either measure. That said, given the industry’s push toward sustainability, the ISO 14001 certification may give luxury hotels some competitive advantage and allow market share gains against their competitive set.

Regarding the general sample, our results indicate significant differences between the two sets of hotels in guest satisfaction for housekeeping accuracy, hotel comfort, and hotel services. Looking at the results for the guest segments, the satisfaction effect is stronger in hotel comfort and hotel services in all the studied subgroups. In short, guests reward hotels that have the ISO14001 certification with higher ratings than those that don’t have it. We encourage hotel marketing decision-makers to advertise their active eco-friendly practices to allow environmentally conscious customers make better informed purchasing decisions.\textsuperscript{35}

As we mentioned above, hotels that have implemented ISO 14001 in Spain are generally larger than those that have not done so. The mean of the entire sample is 79 employees, while hotels with ISO 14001 averaged 144. Another characteristic of hotels with ISO 14001 is that they have higher room rates. The ADR mean of the entire sample is €64.56, while hotels with ISO 14001 averaged €85.

At the same time, the certified hotels scored higher on certain features. In the analysis of the sample segmented by type of visitor, after comparing clients’ rating of hotels with ISO 14001 and those without, we found significant differences in ratings of comfort, location, and services in all guest segments. Additionally, it can be seen that hotels with ISO 14001 show significantly higher rates in cleanliness compared with the whole sample and as judged by families with grown children and by older couples. Therefore, we found that hotels with ISO14001 certification receive higher customer ratings regarding the various attributes that mea-

\textsuperscript{34} See: Segarra-Oña, Peiró-Signes, and Verma (2011), \textit{op.cit.}

sure customer satisfaction compared to the hotels without environmental certification and that an unequal influence on the customers’ rating of service quality aspects can be observed in hotels environmentally certified through the ISO 14001 standard, depending on the type of customer. Our findings showed that ISO 14001 certification contributes to value creation because clients’ ratings are significantly higher in certified hotels. Thus, we consider that ISO 14001 should be a measure of management performance.

These results imply that hotels may be able to acquire a distinctive asset that leads them to a competitive advantage over similar non-environmentally oriented properties if they are ISO 14001 certified, particularly those in upscale market segments. The results show that hotels with proactive practices exhibited a positive effect on the customers’ decision formation.36

The most interesting finding is that 5-star and 3-star hotels don’t seem to gain added value from this certification, while guests at 4-star hotels in this study regarded ISO 14001 as a distinctive hotel asset.

These results have important managerial implications, considering that sustainability represents a great opportunity for the hospitality industry.37 The results suggest that hotel managers should consider implementing the ISO 14001 environmental management system, particularly if they are competing in a market segment where such a certification would provide a point of differentiation, notably the upscale 4-star segment. Studies have demonstrated that it helps to improve productivity and hotel performance, especially in those aspects related to housekeeping accuracy and hotel comfort.

To sum up, our analysis shows that there are significant differences between hotels that have adopted the ISO 14001 proactive environmental management tool from the clients’ point of view. However, there is still a research gap in the understanding of what part (or how much) of the higher rankings is due to the implementation of the ISO 14001 and to what extent other attributes are acting as moderating factors. ■
